

Marketing Lead, Start Here

What Muse is, what marketing is for here, what is already decided, what is genuinely yours to shape, and what has already been made so you are not starting from zero.

Written for someone who has never heard of Muse before today.

COMPANY

Muse Studios, Riyadh

STAGE

Brand done, website in progress, nothing published yet

YOUR PILLAR

Brand and Marketing

ALREADY PREPARED

Batch 01, six ready-to-post content experiments

01 What Muse actually is

A Saudi product company in Riyadh, at the very start, doing three things at once.

Our own apps

We find products that already work outside the Kingdom, understand why they work, and build the version that fits here. Not reinventing anything. Careem did this with the Uber model, Jahez did it with delivery. One that works pays for all the ones that do not.

Brand and marketing

This is your pillar. Building an audience through content that is genuinely useful, that does not sound like a company. What that audience is actually for is on the next page.

Client work

Product, design, development, branding and marketing for other businesses. This is where the money comes from at the start, and it funds the other two pillars.

The honest starting point

Brand identity is finished. The website is in progress. Social accounts exist but have no logo, no bio, and nothing posted. There is no audience yet and no client case studies yet. You are building this from nothing, not inheriting a running account. That is worth saying plainly because it changes what week one looks like.

WHY THREE THINGS AT ONCE

Client work funds the other two and teaches us what businesses here actually struggle with. Marketing means client work arrives inbound instead of by chasing, and gives every product launch a starting audience instead of a cold App Store listing. Product ventures prove we can ship, which is what makes a client trust us with their own product. The pillars are not separate departments, they feed each other on purpose.

02 What marketing is actually for

This pillar earns no direct revenue, which is exactly why it has to be named as a pillar. Otherwise it becomes the thing that never happens the moment a client project lands.

WHAT IT BUYS	WHAT IT LOOKS LIKE WHEN IT WORKS
Inbound client work	Someone remembers Muse unprompted when their company needs product or design work. Cheaper than any sales process, and it lets us charge properly.
A launch audience	Every product Muse builds needs people to publish to on day one, instead of shouting into an empty room.
Institutional access	Being known to the entities that back startups here, ministries and large organisations, before we need anything from them.
Standing for the team	Anyone who works at Muse should leave more known and more employable than they arrived, whether they stay two years or ten.

The single most important instruction

Close to people, not corporate. If a caption could have been written by any company, rewrite it.

Big local firms all sound the same. Sounding like them makes Muse look smaller, not bigger. Muse says "we" and "I", people appear by name, posts show the messy middle and not only the finished thing, and there are no announcements about how excited we are to announce something. Humour is allowed. Forced humour is worse than none.

PERSONAL ACCOUNTS DO THE HEAVY LIFTING

In this market, personal accounts outperform a company account by a wide margin. A logo posting a tutorial gets a fraction of the reach the same tutorial gets from a named person. The model: the team posts as themselves, the company account amplifies and holds the archive, and nobody is required to post.

03 Already decided, so you are not walking into a blank page

Worth naming clearly, because it shows the thinking is real and stops you relitigating settled questions.

- ☐ The identity is finished and is not being redesigned. Orange on maroon, Space Grotesk for English, IBM Plex Sans Arabic for Arabic
- ☐ The voice is human and close to people, never corporate, no banned phrases, no announcements
- ☐ Behind-the-scenes content of the team actually working is wanted, not just polished output
- ☐ Real things only. No invented numbers, no mockups presented as shipped work, no AI slop published as ours
- ☐ Arabic and English both matter, both written natively, never translated
- ☐ Client work has first call on shared people and time. When a client engagement is active, it wins

Not yours to decide

- Product decisions and which venture Muse builds next
- Sales, pricing and client proposals
- The brand identity itself

Genuinely yours to shape

- Which two or three channels to start with, and which to ignore for now
- What cadence is actually sustainable. A small rhythm held for a year beats a big one held for a month
- Which audience to build first: practitioners, buyers, or consumers. A recommendation exists and is worth arguing about
- Whether free templates and assets are a main pillar or an occasional thing
- What the one thing is Muse wants to be known for

04 How content actually gets made

Five kinds of post. A healthy week has more than one kind in it.

PILLAR	WHAT IT IS
Useful craft	Tips, techniques, breakdowns. The thing someone saves and sends to a colleague. Muse's strongest unclaimed territory is Arabic and RTL specifics that almost everyone gets wrong.
Free assets	Templates, checklists, starter kits. Highest saves and shares of anything postable, and the most direct path from a follower to a lead.
Behind the scenes	The team working, explicitly not corporate. A problem being argued about, with the disagreement left in.
Working in the open	What Muse is building right now, including unfinished ventures. Numbers once products are live, and what happened after a launch.
Opinion and commentary	Highest risk, highest return. How a company becomes a name people quote rather than an account people follow. Never punches down at a named local company.

The production model

Capture continuously, produce in batches. Somebody films and screenshots while real work happens. Editing happens in one session, not per post. Raw beats polished for behind-the-scenes and working-in-the-open. One person owns publishing, since content by committee arrives late and sounds like nobody.

SURVIVING A BUSY CLIENT MONTH

Keep a two to four week buffer of finished content, built when the studio is quiet. Client work is content too, with permission. Drop the cadence deliberately and say so, rather than going silent with no explanation. Never apologise for a gap, just resume.

05 What is already prepared for you

Before you arrive, Muse already ran one full content batch as a proof of process: six source-backed social experiments, ready to post, in Muse’s voice.

#	TOPIC	PRIMARY METRIC
1	Picking an AI model without chasing leaderboards	Saves
2	Running parallel AI coding agents without chaos	Saves
3	Why one benchmark run can mislead you	Substantive replies
4	Trusting AI too much, then too little	Substantive replies
5	AI code volume versus long-term maintainability	Quote posts
6	Arabic benchmark quality and native models	Real conversations

What each one includes, already written

- ☐ Full slide-by-slide carousel copy, four to five slides per experiment
- ☐ A ready-to-paste X thread version of each
- ☐ A founder interaction playbook: what to reply to before posting, what to reply to after, who to quote-post
- ☐ Every claim traced to a verified, fetchable source, listed in a source register
- ☐ A named primary metric per post, so results can be compared fairly

This is not a content calendar of ideas. It is finished, checkable, ready-to-post material.

Full files live in Muse Vault, under “03 Marketing / AI Content Experiments / batch-01”. A companion PDF walks through all six in more visual depth.

06 How Muse measures marketing, in order

Same discipline as the product side. The flattering numbers are the ones platforms put on the front page. They are not the ones that matter.

#	WHAT MATTERS
1	Real conversations. How many people got in touch because of something posted. The only number that connects to revenue, and it is countable by hand.
2	Saves and shares. Someone keeping a post or sending it to a colleague is worth far more than a like, and it is the signal algorithms actually reward.
3	Repeat viewers. People coming back, the audience equivalent of retention.
4	Audience composition. Who is actually following, checked quarterly. A smaller audience of the right people beats a bigger one of the wrong people.
5	Consistency. Whether Muse published what it said it would. The most predictive number in year one, since almost every content account dies of stopping, not of bad content.

WHAT NOT TO CELEBRATE

Followers, likes, impressions, reach. They move for reasons unrelated to anything you did, and optimising for them produces content that gets attention and no clients. No invented numbers, ever, in a deck, a pitch, or a post.

Comparing posts fairly

Raw totals favour whichever post got lucky reach. Compare rates instead: primary metric count per 1,000 people reached. A small post with a high save rate can beat a big post with a low one. The reusable post log in batch-01 already tracks this shape, ready for you to fill in as posts go out.

07 A realistic first stretch, and what Abdullah will ask

Offered as a starting shape to rework together, not a schedule handed to you.

First

Get the accounts activated. Logo, bios in both languages, handles consistent, a contact route someone actually watches.

Then

Agree the channels, the cadence, and the first content pillar. Post the first items from Batch 01, since they are already written and verified.

Then

Fill in the post log as results come in. Read every substantive reply and DM. That becomes the next batch's topics.

What Abdullah will actually ask you

- ☐ What audience have you built before, and what actually worked
- ☐ Show something you made that you are still proud of, and something that flopped
- ☐ How do you write in Arabic, natively or translated
- ☐ What do you honestly think of Muse's brand, now that you have seen it
- ☐ Which local accounts do you think are doing this well, and why
- ☐ How much time can this realistically have in a normal week

Marketing at twenty percent of someone's attention still works if the cadence matches the attention. It fails when the plan assumes full time and the reality is not.

08 What good looks like, deliberately modest

The first stretch of a content account is slow. Pretending otherwise sets everyone up to feel like it failed.

- ☐ The accounts look alive and have not gone silent for a month
- ☐ Somebody outside Muse's circle has reached out because of something posted
- ☐ Muse knows who its audience actually is well enough to describe them in a sentence
- ☐ The team is posting under their own names, not only the company account
- ☐ One repeatable format exists that is easy to keep making

THE THING THAT KILLS STUDIO CONTENT

Almost every studio account here follows the same arc: ten good posts, then a client project lands, then silence, then an apology post four months later. Keep a two to four week content buffer built when the studio is quiet, and drop the cadence deliberately with a stated reason rather than going silent. Never apologise for a gap, just resume.

Activation checklist, before publishing anything

- Logo applied everywhere, correct variant per shape. Handles identical across platforms
- Bio written natively in Arabic and English, no banned phrases
- Contact route that someone actually monitors. An unanswered DM is worse than no DM channel
- A pinned first post that introduces the company, written last

An account with no logo and no posts reads as abandoned, which is worse than not existing.

09 Where the batch content lives, and where to start

Everything from Batch 01 is editable and ready. Nothing here is locked or needs to be re-requested.

FILE OR FOLDER	WHAT IT HOLDS
AI-Content-Batch-01.pdf	Visual walkthrough of all six experiments, sources, and the measurement framework
experiments/, threads/	Full editable carousel copy and ready-to-paste X and LinkedIn threads
sources/sources.md	The verified source register behind every claim
post-log.md	The measurement template, fill in as posts go out

Recommended posting order: model releases first, since it is the most time-sensitive, then agent worktrees, AI trust, Arabic benchmarks, benchmark instability, and code maintainability last, since it carries the highest debate risk. Full path: Muse Vault, "03 Marketing / AI Content Experiments / batch-01".

Where to start on day one

- ☐ Read this document, then the Marketing folder in Muse Vault
- ☐ Open the batch-01 PDF and decide which experiment goes first
- ☐ Walk through the activation checklist for whichever two or three channels feel right
- ☐ Come with your honest read on the brand and the batch content, and your own answers to the questions on page 8, before being asked

Welcome. Build the thing that survives a busy month, not the thing that looks good for two weeks.
