

One clear direction for muse.sa.

The recommended direction, why it is right, what the homepage says, how a visitor moves through it, and what the team still needs to decide. Standalone: no earlier revision or research file is required to read it.

DATE	PREPARED FOR	PREPARED BY	REFERENCE
2026-08-07	Muse team	Abdullah Alsubaie	MUSE-DIR-04 · Rev 3

Scope of this deck. English-first; Arabic is written separately once this direction is locked. No pricing, packaged offers, or delivery promises appear on the site. Nothing in the copy claims proof Muse does not have, and the absence of client work is never mentioned. Ready to share with the team and begin design from.

01 The recommended direction

Lead with understanding. Route by intent. Support with capabilities. Prove with real things.

The website opens with a clear, warm statement of what Muse is and what it believes: that good technology begins with understanding people, their needs, and their businesses. It then asks the only question that matters to a visitor, «**how can we help?**», and routes them by what they are trying to achieve. Everything after that is support: the capabilities Muse brings together, how the team thinks and works, and the real things it has made. The site converts by starting the right conversation, not by selling a package.

The tone throughout is human, intelligent, and quietly confident. Nothing argues with the industry, announces confidence, or asks to be judged. A potential client should feel «**they understand what I'm trying to achieve**» before anything else.

Intents route	→	Visitors enter through their goal: bring a new idea to life, improve an existing product, explore AI Transformation. Intents own the homepage and the start flow.
Capabilities combine	→	Strategy & discovery, design, engineering, AI, gamification & experience. They live in one homepage band, the navigation, and their own pages. They never route; they appear inside the intents they serve.
Approach, not framework	→	No invented «Muse Standard» branding. The beliefs behind it become a plain, warm «Our approach» section. If a working checklist ever emerges from real client work, publishing it then will be earned.
Real things only	→	Credibility comes from what anyone can open: experiments, products, writing, and this site itself. The section is built as slots that client work naturally fills later.

02 Why this direction

The five insights that actually shaped the site, each tied to the decision it produced.

Visitors arrive with a goal, not a service taxonomy.	→	Intent-led routing («how can we help?») replaces service menus and the earlier Build / Ventures / Think doors, which mirrored Muse's structure instead of the buyer's.
A new visitor gives the hero about five seconds.	→	The hero must say what Muse is and hint who it's for at a glance. Clever riddle headlines and proof-style claims both fail that test; clarity with a warm point of view passes it.
Muse is new, with limited public proof.	→	Credibility through real artifacts and clarity, not claims: live experiments and products, published thinking, and a site that demonstrates the craft it sells. No borrowed metrics, no logo walls.
The brand needs warmth and intelligence, not confrontation.	→	A human voice throughout, and «Our approach» instead of an invented authority framework. Nothing anti-agency, nothing defensive, no announcing how different Muse is.
Two different readers shop two different ways.	→	Problem-holders route by situation; evaluators and referrals look for named skills. So the architecture has two layers: intents on the homepage, capabilities in the navigation and on their own pages.

03 Benchmark: what we learned

Six references from the completed research, each reduced to the one pattern that influenced Muse. Tiles are pattern sketches; live captures sit in the benchmark file and the final walkthrough.

thoughtbot
thoughtbot.com

Two layers that never compete: the menu organizes skills by discipline, the homepage routes by the client's situation. Authority built by publishing how they work.

Influence: the intent / capability split, and «Our approach» as substance rather than slogan.

MetaLab
metallab.com

«We make interfaces.» One compressed identity line carries the whole brand; the confidence is in the restraint, not in adjectives.

Influence: hero discipline: identity and warmth in very few words, personality through clarity.

Netguru
netguru.com

Every page funnels into one guided «tell us about your project» flow instead of a bare contact form.

Influence: the /start journey: a short, intent-led conversation starter as the site's single conversion path.

Musemind
musemind.agency

Nearly every surface opens with the buyer's pain in the buyer's words, then shows the way out. Services are packaged as situations.

Influence: problem-first copy on intent cards and capability pages: the client's goal is always the subject.

Intellias Saudi
intellias.com/intellias-saudi

Local operational legitimacy stated concretely: a Saudi entity, teams on the ground, national-agenda alignment. Trust for institutional buyers.

Influence: «Why Muse»: being genuinely Saudi and in Riyadh said plainly, as fact rather than flavor.

TAM
tam.sa

Routes government and enterprise buyers by the outcomes they're mandated to achieve, and earns trust through documented methods and its own products.

Influence: outcome-shaped intent labels, and own products in «From the studio» as honest authority.

Also from the research: The Octalysis Group shaped how Gamification & Experience is presented (outcomes and habit-building, not game mechanics), and AZM X served as the local anti-pattern: nine abstract service doors and no way for a visitor to find their problem.

04 The Muse website model

Clients enter through what they're trying to achieve. Muse combines the right capabilities around that goal.

CUSTOMER INTENT • HOW VISITORS ENTER

MUSE CAPABILITIES • WHAT GETS COMBINED

Every project draws on several capabilities at once. The visitor never has to know which; they choose a goal, and **Muse assembles the team around it.**

Site map: Home · /start (guided conversation) · /build, /improve, /ai (intent pages) · /capabilities (five pages) · /approach · /notes · /about · legal. Capability pages always end by routing back into an intent. Orange chips mark the two specialist capabilities that get signature treatment.

05 Homepage architecture

Eight sections, one job each. Full copy for every section follows in 07 to 09.

1	Hero	Immediate understanding of Muse, plus a warm point of view.	One CTA into /start.
2	How can we help?	Three intent cards route by what the visitor is trying to achieve.	Cards link to intent pages; quiet link to capabilities.
3	What we bring together	The five capabilities, one human sentence each.	Links to capability pages.
4	Our approach	How Muse thinks and works: people first, design and engineering together, close collaboration.	Reading section.
5	Why Muse	A small Saudi multidisciplinary team; local understanding; specialist depth; direct collaboration.	Reading section.
6	From the studio	Only real things: experiments, products, writing. Built as slots client work fills later.	Outbound links to live things.
7	FAQ	Useful buying questions only.	Accordion.
8	Start a conversation	One warm ask into the intent-led flow.	Into /start; footer follows.

06 Hero: three territories

TERRITORY A • UNDERSTANDING FIRST • RECOMMENDED

Great products begin with understanding.

Muse is a product studio in Riyadh. We bring together strategy, design, engineering and AI to turn ideas and challenges into digital products made for real people.

[\[Start a conversation \]](#)

The thoughtful partner: the belief leads, the support line answers what and where Muse is. Headline and support must always appear together, and the rest of the page has to make «understanding» true rather than decorative.

TERRITORY B • THE CLEAR INTRODUCTION

Thoughtful digital products, designed and built in Riyadh.

From new ideas to products already out in the world, Muse combines product thinking, design, engineering and AI to make technology feel considered and human.

[\[Start a conversation \]](#)

The calm specialist: the headline alone passes the five-second test. The safe fallback if A reads too abstract in testing.

TERRITORY C • MADE TOGETHER

Let's make something people will love using.

Muse is a small multidisciplinary studio in Riyadh: product thinkers, designers and engineers who work directly with you, from first idea to living product.

[\[Start a conversation \]](#)

The invitation: collaboration and smallness as strengths. Whichever hero wins, this support line deserves a home on the site.

Recommendation: Territory A. It expresses the emotional center of the direction, and «how can we help?» follows it naturally. Sanity-check all three with a few cold readers on real mockups; design does not wait for the result.

07 Homepage copy: intents + capabilities

SECTION 2 • HOW CAN WE HELP?

How can we help?

Every project starts somewhere different. Where are you today?

Bring a new idea to life. You have an idea, a plan, or a problem worth solving. We help you shape it, design it, and build it into a product people can actually use. → [Start something new](#)

Make an existing product better. You already have a product, and you sense it could be more. We help you understand what's holding it back, then improve it thoughtfully, or rebuild the parts that need it. → [Improve a product](#)

Explore AI for your business. AI is full of promise, and full of noise. We help you find where it genuinely helps your business and your customers, then build it into how you work. → [Explore AI Transformation](#)

Looking for a specific capability? See what we bring together below.

SECTION 3 • WHAT WE BRING TOGETHER

What we bring together

One team, five disciplines. Most projects draw on several at once.

Product Strategy & Discovery. Understanding your users, your business, and the problem itself, so we build the right thing before we build anything.

Product & Experience Design. Interfaces and experiences that feel clear, considered, and natural to use, in Arabic and English alike.

Product Engineering. Reliable, well-crafted software, built by senior engineers who stay close to the product and to you.

AI. Practical intelligence inside products and workflows: features and systems that quietly make things easier for the people using them.

Gamification & Experience. The craft of motivation. We design the moments, feedback, and rewards that help people form real habits with a product, instead of trying it once and drifting away.

08 Homepage copy: approach, why Muse, from the studio

SECTION 4 • OUR APPROACH

Our approach

A few beliefs shape everything we make.

Start with people. We spend time understanding your users and your business before we design anything. Good decisions come from context, not templates.

Design and engineering, one conversation. The people who design your product and the people who build it work side by side, so ideas survive the journey from sketch to software.

Show, early and often. You'll see real progress from the first weeks, and you'll always be talking directly with the people doing the work.

Care for the quiet details. An empty screen, an error message, a first-time experience: the small moments are where products earn trust, so we design them with the same care as the big ones.

SECTION 5 • WHY MUSE

Why Muse

We're a small, multidisciplinary Saudi team: product thinkers, designers, and engineers who genuinely enjoy building together. We understand this market, its people, and the way products need to feel here, because it's home.

Being small is deliberate. It means design and technology live under one roof, specialist depth in AI and engagement design sits in the same room as the engineers, and the people you talk to are the people shaping and building your product.

SECTION 6 • FROM THE STUDIO

From the studio

We like making things, for our clients and for ourselves. Our own products and experiments are where we test ideas, sharpen our craft, and explore what's next. You're welcome to look around.

Cards, each linking to something live: Muse Experiments (open source) · Tenet (early access) · Notes (our writing) · How we built this site. A grid of slots, so client work takes its place here naturally as it becomes real and shareable.

09 Homepage copy: FAQ + final ask

SECTION 7 • QUESTIONS PEOPLE ASK US

What kinds of projects do you take on? New products from the first idea, existing products that need care or a rethink, and focused work in design, engineering, AI, or engagement. Our clients range from founders to established organizations.

Who will we actually be working with? A small senior team. The people you meet in the first conversation are the people who will design and build your product.

How do projects usually start? With a conversation. We listen, ask a lot of questions, and take time to understand what you're trying to achieve. If we believe we can genuinely help, we come back with a clear picture of how we'd approach it.

What does AI Transformation mean at Muse? Finding where AI genuinely helps your business, your operations, your customers, or your product, and building it in thoughtfully. We care most about what your team will actually use day to day.

What is Gamification & Experience? The psychology of engagement, applied with care. New tools compete with old habits, so we design the onboarding, feedback, and reward systems that help a change stick, in products, learning, and workplaces.

SECTION 8 • START A CONVERSATION

Tell us what you're working on.

We'd love to hear about it. Your first conversation is with the people who would design and build it.

[\[Start a conversation \]](#)

10 The lead journey

It should feel like the beginning of a good meeting, not a form.

«What are you looking to do?»

Build something new

«Tell us a little about the idea.» + «Where is it today?» (a thought · a plan · designs · a prototype)

Improve an existing product

«Tell us a little about the product.» + «What feels most important right now?» (experience · performance · growth · a rethink)

Explore AI Transformation

«What would you most like AI to help with?» (operations · customers · your product · not sure yet)

I need a specific capability

«Which one?» (the five capabilities) + «A line or two about the work.»

I'm not sure yet

Straight to: «Tell us what's on your mind.» (open text)

Every path ends the same way: name, how to reach you, and a choice between «book a call» and «write to us». Two screens maximum after the first question, and a visible way to skip straight to a call on every screen. No pricing, no packages, no timelines anywhere in the flow.

11 Open decisions + next step

None of these block design.

- ☐ **Hero territory.** A is recommended; sanity-check A, B, and C with a few cold readers on real mockups.
- ☐ **Intent card labels.** «Bring a new idea to life» / «Make an existing product better» / «Explore AI for your business» are working labels; confirm final wording alongside the hero check.
- ☐ **Team identity.** Named, anonymous, or no names on the site with full identity in the first call. Only /about and one FAQ answer are affected; the copy already works for all three.
- ☐ **«From the studio» at launch.** Confirm which experiments and products are genuinely ready to be looked at; the section only works if everything in it is real and live.
- ☐ **Capability naming.** «AI» vs. «AI Engineering» as the capability label; the intent page stays «AI Transformation» either way.
- ☐ **Arabic.** Written separately, from scratch, as Arabic, once this English direction is locked. Not a translation pass.

Next step. Align on this deck in the working session, then design begins from it directly. The full MUSE-DIR walkthrough (section-exact captures, verbatim copy, evidence) is produced once the hero and label checks are done.
